

5-PS2-1 Motion and Stability: Forces and Interaction

Students who demonstrate understanding can:

- 5-PS2-1. Support an argument that the gravitational force exerted by Earth on objects is directed down.** [Clarification Statement: “Down” is a local description of the direction that points toward the center of the spherical Earth.] [Assessment Boundary: Assessment does not include mathematical representation of gravitational force.]

The performance expectation above was developed using the following elements from the NRC document *A Framework for K-12 Science Education*:

Science and Engineering Practices	Disciplinary Core Ideas	Crosscutting Concepts
<p>Engaging in Argument from Evidence Engaging in argument from evidence in 3–5 builds on K–2 experiences and progresses to critiquing the scientific explanations or solutions proposed by peers by citing relevant evidence about the natural and designed world(s).</p> <ul style="list-style-type: none"> Support an argument with evidence, data, or a model. 	<p>PS2.B: Types of Interactions</p> <ul style="list-style-type: none"> The gravitational force of Earth acting on an object near Earth’s surface pulls that object toward the planet’s center. 	<p>Cause and Effect</p> <ul style="list-style-type: none"> Cause and effect relationships are routinely identified and used to explain change.

Observable features of the student performance by the end of the grade:							
1	Supported claims						
	a Students identify a given claim to be supported about a phenomenon. The claim includes the idea that the gravitational force exerted by Earth on objects is directed down toward the center of Earth.						
2	Identifying scientific evidence						
	a Students identify and describe* the given evidence, data, and/or models that support the claim, including: <table border="1" style="margin-left: 20px;"> <tr> <td>i.</td> <td>Multiple lines of evidence that indicate that the Earth’s shape is spherical (e.g., observation of ships sailing beyond the horizon, the shape of the Earth’s shadow on the moon during an eclipse, the changing height of the North Star above the horizon as people travel north and south).</td> </tr> <tr> <td>ii.</td> <td>That objects dropped appear to fall straight down.</td> </tr> <tr> <td>iii.</td> <td>That people live all around the spherical Earth, and they all observe that objects appear to fall straight down.</td> </tr> </table>	i.	Multiple lines of evidence that indicate that the Earth’s shape is spherical (e.g., observation of ships sailing beyond the horizon, the shape of the Earth’s shadow on the moon during an eclipse, the changing height of the North Star above the horizon as people travel north and south).	ii.	That objects dropped appear to fall straight down.	iii.	That people live all around the spherical Earth, and they all observe that objects appear to fall straight down.
i.	Multiple lines of evidence that indicate that the Earth’s shape is spherical (e.g., observation of ships sailing beyond the horizon, the shape of the Earth’s shadow on the moon during an eclipse, the changing height of the North Star above the horizon as people travel north and south).						
ii.	That objects dropped appear to fall straight down.						
iii.	That people live all around the spherical Earth, and they all observe that objects appear to fall straight down.						
3	Evaluation and critique						
	a Students evaluate the evidence to determine whether it is sufficient and relevant to supporting the claim.						
	b Students describe* whether any additional evidence is needed to support the claim.						
4	Reasoning and synthesis						
	a Students use reasoning to connect the relevant and appropriate evidence to support the claim with argumentation. Students describe* a chain of reasoning that includes: <table border="1" style="margin-left: 20px;"> <tr> <td>i.</td> <td>If Earth is spherical, and all observers see objects near them falling directly “down” to the Earth’s surface, then all observers would agree that objects fall toward the Earth’s center.</td> </tr> <tr> <td>ii.</td> <td>Since an object that is initially stationary when held moves downward when it is released, there must be a force (gravity) acting on the object that pulls the object toward the center of Earth.</td> </tr> </table>	i.	If Earth is spherical, and all observers see objects near them falling directly “down” to the Earth’s surface, then all observers would agree that objects fall toward the Earth’s center.	ii.	Since an object that is initially stationary when held moves downward when it is released, there must be a force (gravity) acting on the object that pulls the object toward the center of Earth.
